Comprehensive Linux Operations

Project Overview

This project spans various aspects of Linux system administration, including file management, user and group management, service control, process handling, and more. You will be completing tasks that simulate real-world scenarios, providing hands-on experience with Linux commands and configurations.

Project Breakdown

Part 1: Creating and Editing Text Files (20 minutes)

Scenario: You are tasked with documenting the configurations and settings for a new server. You'll use different text editors to create and update these documents.

1. Using Nano

```
Create a file server_config.txt using Nano:
```

```
nano server_config.txt
```

0

Add the following content:

```
Server Name: WebServer01 IP Address: 192.168.1.100
```

OS: Ubuntu 20.04

Save and exit (Ctrl+O, Enter, Ctrl+X).

2. Using Vi

Edit the same file with Vi:

```
vi server_config.txt
```

0

Append the following text:

```
Further edit the file with Vim:
vim server_config.txt
         0
Add the following text:
Configuration Complete: Yes

    Save and exit (Esc, :wq).

Part 2: User & Group Management (20 minutes)
Scenario: You need to set up user accounts and groups for a new team joining the project.
   1. Adding/Removing Users
Add a new user developer:
sudo adduser developer
Remove the user developer:
sudo deluser developer
   2. Managing Groups
Create a group devteam:
sudo groupadd devteam
Add the user developer to the devteam group:
sudo usermod -aG devteam developer
Remove the user developer from the devteam group:
sudo gpasswd -d developer devteam
```

Part 3: File Permissions Management (20 minutes)

0

Scenario: Ensure that only the appropriate users have access to specific files and directories.

1. Understanding File Permissions

View permissions for server_config.txt:

```
ls -l server_config.txt
```

- Discuss the output (e.g., -rw-r--r--).
- 2. Changing Permissions and Ownership

Change permissions to read/write for the owner and read-only for others:

```
chmod 644 server_config.txt
```

Verify the change:

```
ls -l server_config.txt
```

0

Change the owner to developer and the group to devteam:

```
sudo chown developer:devteam server_config.txt
```

0

Verify the change:

```
ls -l server_config.txt
```

0

Part 4: Controlling Services and Daemons (20 minutes)

Scenario: Manage the web server service to ensure it is running correctly and starts on boot.

1. Managing Services with systemctl

Start the Apache service:

```
sudo systemctl start apache2
```

0

```
Stop the Apache service:
sudo systemctl stop apache2
          0
Enable the Apache service to start on boot:
sudo systemctl enable apache2
Disable the Apache service:
sudo systemctl disable apache2
          0
Check the status of the Apache service:
sudo systemctl status apache2
   2. Understanding Daemons
          o Discuss the role of the sshd daemon in providing SSH access to the server.
Part 5: Process Handling (20 minutes)
Scenario: Monitor and manage processes to ensure the server is performing optimally.
   1. Viewing Processes
List all running processes:
ps aux
          0
Use top to view processes in real-time:
top
   2. Managing Processes
Identify a process to kill using ps or top, then kill it:
kill <PID>
```

Change the priority of a process (e.g., running sleep with a lower priority):

```
nice -n 10 sleep 100 &
```

0

Change the priority of the process using renice:

```
renice +10 <PID>
```

Creating and Deploying a Static Website with Apache2

Preparation (5 minutes)

• Ensure you have access to a Linux environment (e.g., virtual machines, EC2 instances, or local installations) with sudo privileges.

Activity Breakdown

Part 1: Installing Apache2 (5 minutes)

1. Update Package Lists

Open the terminal and run:

```
sudo apt update
```

0

2. Install Apache2

Install Apache2 by running:

```
sudo apt install apache2
```

0

3. Start and Enable Apache2

Start the Apache2 service:

```
sudo systemctl start apache2
```

0

Enable Apache2 to start on boot:

```
sudo systemctl enable apache2
```

0

4. Verify Installation

 Open a web browser and navigate to http://your_server_ip. You should see the Apache2 default page.

Part 2: Creating the Website (10 minutes)

1. Navigate to the Web Directory

```
Change to the web root directory:
```

```
cd /var/www/html
```

0

2. Create a New Directory for the Website

Create a directory named mystaticwebsite:

```
sudo mkdir mystaticwebsite
```

0

Change ownership of the directory:

```
sudo chown -R $USER:$USER /var/www/html/mystaticwebsite
```

0

3. Create HTML File

Create and edit the index.html file:

```
nano /var/www/html/mystaticwebsite/index.html
```

0

Add the following content:

```
</html>
         o Save and exit (Ctrl+O, Enter, Ctrl+X).
   4. Create CSS File
Create and edit the styles.css file:
nano /var/www/html/mystaticwebsite/styles.css
         0
Add the following content:
body {
  font-family: Arial, sans-serif;
  background-color: #f0f0f0;
  text-align: center;
  margin: 0;
  padding: 20px;
}
h1 {
  color: #333;
}

    Save and exit (Ctrl+O, Enter, Ctrl+X).

   5. Create JavaScript File
Create and edit the script.js file:
nano /var/www/html/mystaticwebsite/script.js
         0
Add the following content:
document.addEventListener('DOMContentLoaded', function() {
  console.log('Hello, World!');
});
```

```
Save and exit (Ctrl+O, Enter, Ctrl+X).

6. Add an Image

Download or copy an image file (e.g., logo.png) to the website directory:

cp /path/to/your/logo.png /var/www/html/mystaticwebsite/logo.png

Update index.html to include the image:
```

```
<body>
<h1>Welcome to My Static Website</h1>
<img src="logo.png" alt="Logo">
  This is a simple static website using Apache2.
<script src="script.js"></script>
</body>
```

Part 3: Configuring Apache2 to Serve the Website (10 minutes)

1. Create a Virtual Host File

Create and edit the virtual host configuration file:

Add the following content:

```
<VirtualHost *:80>
   ServerAdmin webmaster@localhost
   DocumentRoot /var/www/html/mystaticwebsite
   ErrorLog ${APACHE_LOG_DIR}/error.log
   CustomLog ${APACHE_LOG_DIR}/access.log combined
</VirtualHost>
```

Save and exit (Ctrl+O, Enter, Ctrl+X).

2. Enable the New Virtual Host

Enable the virtual host configuration:

sudo a2ensite mystaticwebsite.conf

C

3. Disable the Default Site

Disable the default site configuration:

sudo a2dissite 000-default.conf

O

4. Reload Apache2

Reload the Apache2 service to apply the changes:

sudo systemctl reload apache2

0

5. Test the Configuration

 Open a web browser and navigate to http://your_server_ip. You should see the static website with the HTML, CSS, JS, and image.
